Clinical Review of Lithium Monitoring

1. Background

Lithium remains the **gold standard** for bipolar disorder. *Serum levels* must be checked 12 hours after the last dose. Toxicity can be fatal. This paragraph is long enough to wrap across several lines so the justification and spacing can be seen clearly on the page.

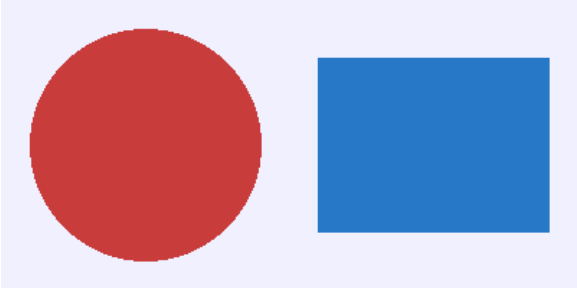

2. Monitoring schedule

- Baseline renal and thyroid function
- Levels weekly until stable
- Every three months in the first year
    - Calcium yearly

1. Explain the signs of toxicity
2. Give the patient a booklet
3. Document the discussion

2.1 Results table

Test	Target	Notes
Lithium	0.6–0.8 mmol/L	Higher in mania
eGFR	> 60	Merged down: check both together
TSH	0.5–4.0	

See the RANZCP guideline for details.
